

# ET'S MICROBE ACTIVATED BARLEY

## Description

Enviro-Tech's new Microbe Activated Barley Straw is specially designed to help achieve the best water quality possible for lakes and ponds. The bacteria in the Barley Straw reduces sludge in the bottom of the lake or pond while the Barley Straw itself decomposes and creates a unique environment like no other.

Since ET's Microbe Activated Barley Straw contains no chemicals it is safe for fish, waterfowl and humans. In most cases there has been an increase in the invertebrate population providing a food source for the fish. Some studies have even shown not only improved gill function but overall improved fish health.

## Application

Product should be applied early in the spring and once more in about 6 months. Make sure when you apply that the water temperature is lower, around April is a good time for the first application. It will take about 30 days to fully activate and the treatment itself should last about 6 months. If your pond has a high content of suspended mud it may be necessary to add more straw than in clear waters since the mud slowly deactivates the straws byproducts.

ET's Microbe Activated Barley Straw is most effective when it is submerged in the water, not totally sunk. This partial submersion increases the amount of oxygen it is exposed to which helps decomposition and release of the natural & beneficial compounds.

The amount needed for treatment depends on the surface area NOT the volume of the pond or lake. 10 sacks of product should be used per acre. If you are in an extremely hot climate where decomposition will accelerate then less should be used.

**WARNING: Do NOT over dose, this can result in a fish kill from lack of oxygen in the water.**

**Simply tie off and float  
for continuous treatment!**

**Apply Twice a Year for Desired  
Results**

**Environmentally Friendly**

**All Natural Formula**

**Now Available for Evaluation in  
All Types of Lakes and Ponds**
